Excel_To_PowerPoint

AI at Work – Participant Workbook

The 9-Step Copilot Flow — from a raw file to a leadership-ready deck

Course: AI Enablement — Copilot for Reviews & Decks **Tool:** Microsoft Copilot (+ PowerPoint agent) **Companion data for today:** `BFL_Payments_Copilot_Dataset.xlsx` — sheet **Payments Performance** (Apr–Sep 2026), **Reconciliation Tracker** or **Partner SLA Tracker** (Sep 2026)

> **The one thing that changes is the file.** The same nine steps take *any* document — a report, a register, a tracker, a dataset — and turn it into an **analysis**, a **document** and a **leadership deck**. Learn the flow once; run it on your own Payments file the same afternoon.

What you'll be able to do after this

Take any work file and turn it into a sound analysis, a Word document and a leadership deck, using a repeatable 9-step method you can run on your own data the same day.

The method at a glance

The flow uses **three separate chats** on purpose. Keeping them separate is what keeps the output clean.

	Chat	Steps	Why separate
A	Discovery	1–4	Exploring is messy. Let it be messy here.
B	Execution	5–8	Run the real work in a clean context.
C	PowerPoint agent	9	Deck generation is its own tool.

Two steps are **adapted to the room**, **Step 3** and **Step 7**, because the same file makes a different meeting depending on who you are presenting to.

CHAT A — Discovery & Framing

> You never produce the final deliverable here. This chat is for understanding and deciding.

Step 1 — Read & validate comprehension

Do: Attach the file. Ask Copilot to tell you what's in it *before* you trust any analysis.

Type this:

> Read the attached file. Tell me exactly what it contains — the sheets, columns, time periods, key categories, and any targets or status fields. List anything that looks incomplete, ambiguous or inconsistent.

Check: Did Copilot pick up every sheet and column that matters, all the months, and the targets in the sub-title row (for example, Success Rate 98.5% and Auto-reversal within TAT 98%)? If it missed one, it will mis-analyse later. Fix its understanding now.

Why this matters: everything downstream inherits this reading. Ten seconds of validation saves a wrong analysis.

Step 2 — Diverge: what analysis is possible?

Do: Ask for the full menu of analyses, both to cross-check your own idea and to find ones you hadn't thought of.

Type this:

>

> Based on this file, list every meaningful analysis or review someone in my role (Payments Operations) could run. For each, give a one-line description of what it would reveal. Include the obvious checks *and* any less obvious ones you can see in the data.

Check: Does the list include the analysis you already had in mind? That is validation. What's on the list that you *didn't* think of? That is the value.

> **Note:** if your file is a document rather than a table (a circular, a partner agreement, the Payments Operations Standard), "analysis" becomes *review or extraction* — a clause pull, a compliance check or a list of clarification questions.

Step 3 — Prioritise for the room ⟵ *adapt to your audience*

Do: Narrow it down to the 5 highest-impact analyses **for the specific person you're meeting.**

Type this (swap in your audience):

> From that list, pick the top 5 highest-impact analyses for a review meeting with **[the person I'm meeting]**. Prioritise what drives their decision — approve, proceed, escalate or clarify. Explain in one line why each earns a place.

Adapt — same file, different top 5. Who are you walking in to see?

If they're…	They mostly want…
Head of Payments Operations	The headline and the ask: targets missed, the cost of breaches, the one decision needed
Finance / Controller	Unreconciled value, ageing of breaks, compensation as a cost line
Risk & Compliance / Audit	TAT breaches against the Standard, complaint trend, chargeback losses
Vendor / Partner Management	Partner SLAs, outages, RCAs, renewals
Desk leads (UPI, NACH, Cards & PG)	Today's open cases, ageing, evidence deadlines

Your note — who am I meeting, and what do they care about?

>

Step 4 — Meta-prompt: build the prompt for your chosen analysis

Do: Pick ONE analysis. Ask Copilot to *write the prompt* for it (the meta-prompt move).

Type this:

> Act as a prompt engineer. I want to run this analysis on my file: **"[your chosen analysis]."** Write me a precise Copilot prompt that will produce a reviewer's note with a flags table and a clear recommendation. Use a **Role–Task–Context–Format–Tone (RTCFT)** structure.

Result: Copilot gives you a polished prompt. Copy it. **You're done with Chat A.**

CHAT B — Execution & Productising

> Open a **new chat.** Clean context gives clean output.

Step 5 — Run the analysis

Do: Paste the prompt from Step 4 and attach the file again.

Check that the output catches what you'd catch by hand. Read it as the reviewer, not the operator. Are the flags the ones *you* would have raised? Is anything obvious missing, such as a target miss, a TAT breach, a limit breach or an adverse trend?

If it misses one: follow up plainly — "*You didn't flag [the specific thing] — check again against [the target / limit / clause].*"

Step 6 — Create the document

Do: Turn the analysis into a Word document with **Export to Word** (or **Edit in Pages** to collaborate).

Polish prompt (optional):

> Reformat this as a one-page reviewer's note: heading, a flags table, and a recommendation line. Formal tone.

You now hold deliverable #1 — the review document.

Step 7 — Plan the deck for your time slot ⟵ *adapt to your audience*

Do: Ask how to fit this into your actual meeting length and audience.

Type this (swap both):

> I have **[X minutes]** with **[the person I'm meeting]** to walk through this review. How many slides should I use, and what should each cover? Keep it decision-focused.

Adapt: 5 minutes means 3 slides (headline and ask). 15 minutes means 5–6 slides with the flags table. A working session needs an appendix slide as well.

Step 8 — Generate the slide-by-slide outline

Do: Ask for the full outline with suggested visuals.

Type this:

> Generate a slide-by-slide outline based on that plan. For each slide: title, 3–4 bullet points, and a suggested visual (chart, table or icon). Base it only on the analysis we produced — don't invent figures.

You now hold deliverable #2 — the slide outline.

CHAT C — PowerPoint Agent

Step 9 — Build the deck

Do: Paste the Step-8 outline into the **PowerPoint agent** (or **Copilot inside PowerPoint**) to generate the deck. Then check every figure against your Step-6 document before you present.

You now hold deliverable #3 — the presentation.

Worked example — Payments Performance for the Head of Payments Operations

Use this to see the flow end to end on today's file before you try your own.

Step	What you do	What to look for
1	Attach the dataset; ask what the **Payments Performance** sheet contains	Six months (Apr–Sep 2026), 14 metrics, the targets in row 2, and the units (₹ Cr vs ₹ lakh)
2	Ask for every possible analysis	Volume vs success rate, TAT and compensation, chargeback win rate, reconciliation, complaints
3	Prioritise for the **Head of Payments Operations**	The September targets missed; the cost of TAT breaches; which partner drove it
4	Meta-prompt for "*September performance review*"	An RTCFT prompt asking for a flags table and an October recommendation
5	Run it in Chat B	It should flag: volume **+15.5%**; success **98.1%** (target 98.5%); auto-reversal **94.6%** (target 98%); chargeback win **58%**; complaints **214**; compensation **₹92,600**
6	Export to Word	A one-page reviewer's note
7	"*I have 10 minutes with the Head of Payments Operations*"	About 4 slides
8	Outline with visuals	A success-rate trend line, a target-vs-actual table, an actions slide
9	PowerPoint agent	The deck; check every figure against the Word note

> **Try a second room:** run Step 3 again for **Finance / the Controller**, using the **Reconciliation Tracker**. The top 5 changes completely, even though the dataset is the same.

Applying the flow to documents (not just spreadsheets)

Many Payments files are Word or PDF, not Excel. The flow is the same, but **Step 2 changes meaning**: "analysis" becomes "review or extraction".

Document type	Step 2 becomes…
Payments Operations Standard / RBI circular	Obligation and clause extraction + compliance flags
Partner agreement / SLA schedule	Commitments, penalties, renewal terms + gaps
Partner RCA after an outage	Timeline, root cause, fix, open questions to send back
Network chargeback notice	Reason code, deadline, evidence checklist
Customer complaint letter	Facts vs claims, the clause it touches, a draft reply

Everything else stays the same: validate, prioritise for the room, meta-prompt, run in a clean chat, export to Word, then plan and build the deck.

Your turn — run the 9 steps on your own file

Fill this in during the session, then reuse it at your desk.

Step	Your entry
1. File I'm reading	_____
2. Analyses/reviews possible	_____
3. Who I'm meeting + their priority	_____
3. My top 5 → the one I pick	_____
4. Meta-prompt gave me this prompt	_____
5. Key findings from the run	_____
6. Document created? (Y/N)	_____
7. Time slot + slide count	_____
8. Outline ready? (Y/N)	_____
9. Deck built + figures re-checked?	_____

The one rule that never changes

Copilot **reads, analyses, drafts and builds.** You **validate every figure and own every decision.** Reversals, compensation, partner actions and what goes in front of leadership stay yours.
